Subject: RE: Neuhauser LF - partial summary of meeting 2-21-2018

Joyce,

I agree to the statements noted with the exception of the laboratory data which we will provide as quickly as possible when we receive the data. We are test pitting in 2B today to finish that area so Monday is iffy. We will provide all data available be it preliminary or complete by Monday or sooner as it is received. Volume estimates will be based on analytical where possible and on PID if the lab data is not available. Please let me know if you have any questions or there is other information we can provide.

Thanks TJK

Subject: Neuhauser LF - partial summary of meeting 2-21-2018

Dear Tom – This is a partial summary of our meeting this morning. It included but was not limited to the following:

- Per my request, you agreed to provide all preliminary laboratory data for the test pits in 2a and 2b prior to Monday, 2/26/2018.
- Per my request, you agreed to provide preliminary volume estimates for contaminated soils in 2a and 2b based on the depths to bedrock and PID readings prior to Monday, 2/26/2018. I understand that this will be a rough estimate at this point.
- You stated that new maps would be available this week and sent to me with the new survey information showing the perimeters of the excavations overlaid on the EM-61 data. You stated that maps showing cross sections of the excavations would also be available. Please send those to me and Curt Stovall at CDPHE. I would also like hard copies – I can pick those up at the Site if you let me know when they are there.
- We discussed that Stratus would need to propose a temporary closure plan for the open excavations and the stockpiles of contaminated soils. We did not set a deadline yet for submittal of that proposal but it will need to be soon so that proper supplies can be ordered and installed, such as heavy-duty liners for the open excavations and encapsulants for the stockpiles. Other factors for the temporary closure plan include proper characterization and disposal of liquids in the frac tank, temporary closure

and/or disposal of contaminated soils in the roll off bins, decisions for the air monitoring and air sampling, etc.

- With regard to the remaining drums slated to be sampled that had extremely high VOCs: I stated the drums should NOT be sampled if there was a concern regarding personnel safety such as high LEL readings.

Thank you for your assistance.
